Trivet

A weekly balance tracker for Work, Health and Leisure

Almodovar · ADET Final Project

THE PROBLEM

A student juggling coursework, a part-time job, the gym and a reading habit has no single place that shows where this week’s hours went.

Who it’s for

Students and early-career workers aged 18–30 whose week isn't fixed by an employer, a timetable or a parent.

What they use today

A to-do app for work, a separate workout app, Goodreads or memory for books and shows. None of them compare time across areas.

THE IDEA

One week, three pillars, side by side. No made-up ”balance score”.

Work

Projects with a status and due date. Log hours against them.

Health

Push, pull, legs or cardio sessions as a checklist, with a streak.

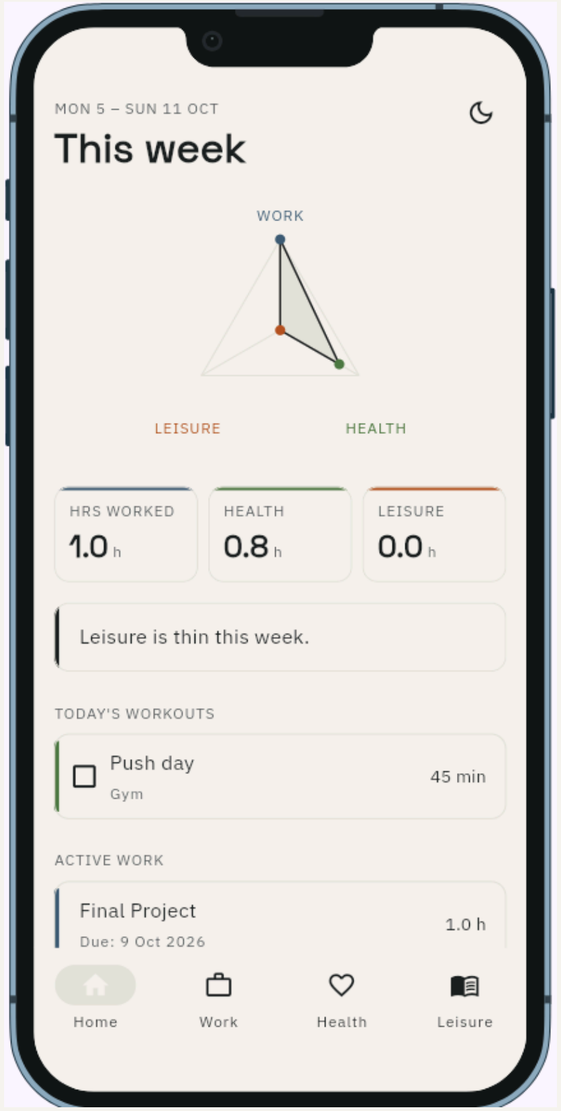

Leisure

Books, films, series and games, with progress and time spent.

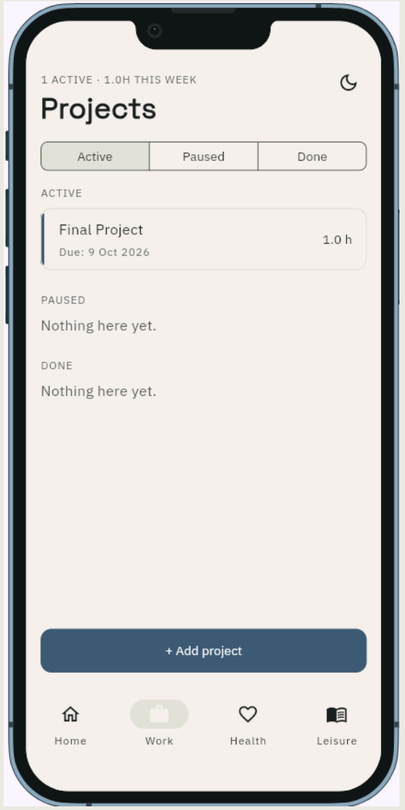

DEMO · DASHBOARD

The whole week on one screen

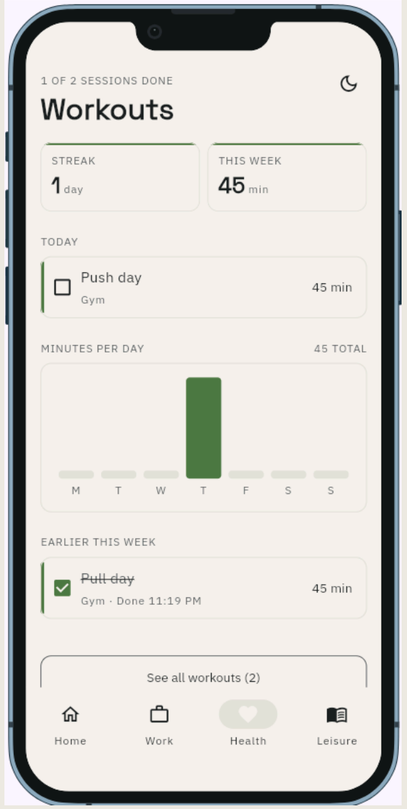

1. **Triad chart:** one point per pillar, drawn with CustomPaint
2. **Stat cards:** this week's hours for each pillar
3. **Nudge:** names the thinnest pillar
4. **Today:** workouts to tick off, active work, what you're enjoying

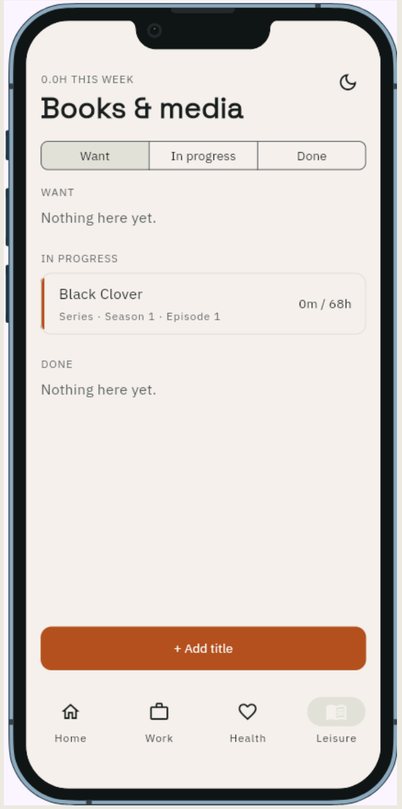

DEMO · THE THREE PILLARS

Work: projects by status, hours this week

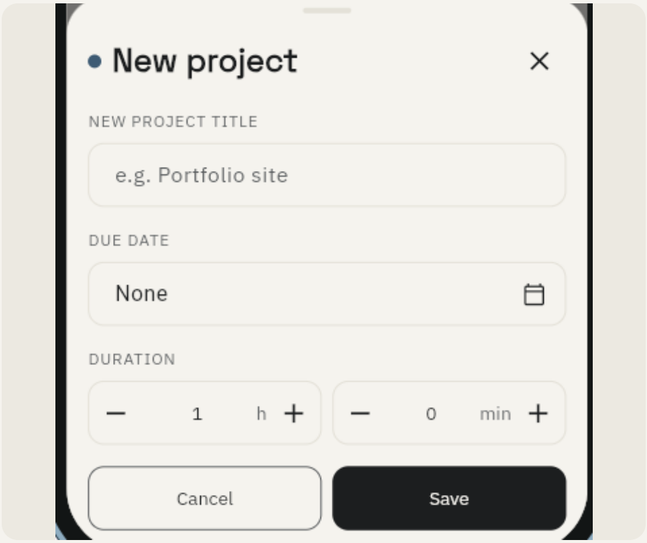

Health: checklist, streak, minutes per day

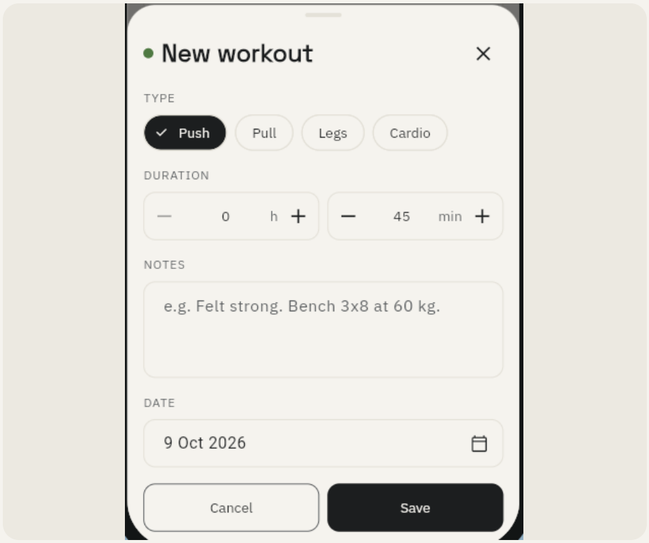

Leisure: want, in progress, done

DEMO · ADDING ENTRIES

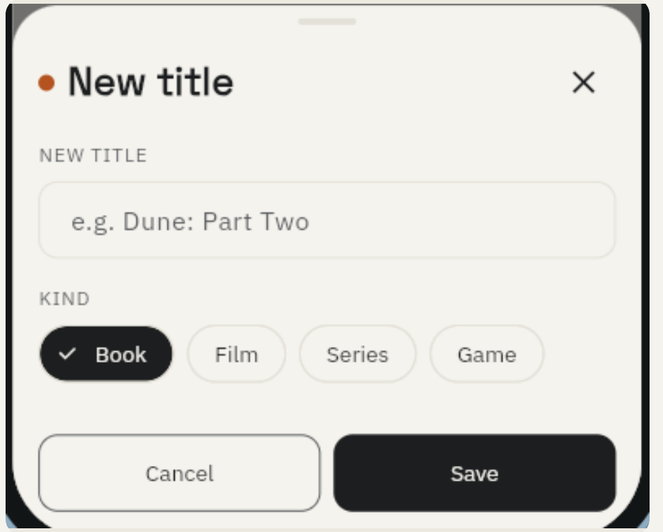

One shared sheet for every pillar

Project: title, optional due date, first hours

Workout: type, duration, notes, date

Title: type a name, pick a search result, totals fill in

HOW IT'S BUILT

Small, offline-first, no backend database

Part	What I used	Why
UI	Flutter, Material 3, my design system	Slate, Moss, Ember; light and dark
State	StatefulWidget + setState per screen	Small app, no package needed
Storage	shared_preferences, one ListStore<T>	Single user, a few hundred records
Search	http, four providers, one service	One source failing never breaks the rest
API keys	Cloudflare Worker proxy	No key ever ships in the app
Deploy	GitHub Actions → GitHub Pages	Live website on every push

CHALLENGES

”This week” is tricky

Week ranges and streaks cross week edges, and daylight saving can shift a day. The week start is built from the date, not by subtracting hours.

Keeping API keys safe

TMDB and RAWG need keys. They live as secrets in a Cloudflare Worker; the app only knows its address.

IGDB → RAWG

IGDB needs a Twitch account and I couldn't finish its 2FA in time, so I switched games to RAWG and removed the IGDB code.

Sources go down

Open Library was unreachable on my network. Each source has an 8-second timeout, so the others still show results.

HOW I USED AI

Claude wrote

Most of the code in lib/: models, storage, screens, theme. Plus the Cloudflare proxy and the deploy workflow.

I wrote

The mockup, design system and proposal. In code: the media search, the rating in suggestions and the poster on the detail screen.

Where it got it wrong

Old workouts vanished from my stats, a locked picker looked broken, Notes and Review shared one field, leftover IGDB code.

Every request, change and fix is logged with its commit in **AI-USAGE.md**.

WHAT'S NEXT

From tracking hours to planning a week

- **Weekly goals per pillar**, shown as progress on the stat cards
- **Tests** for the week-range logic, as my proposal planned
- **Google Books** as a backup when Open Library is down
- **Previous weeks** on the Dashboard, to compare
- **A "follow system" theme** option
- **Source credits** under the poster on the detail screen
