DARK MODE DECISION: LIGHT AND DARK

Both, following the phone setting (ThemeMode.system). Dark is a second ColorScheme and a second PillarColors set, on the next page. The rule that keeps this cheap still holds: no colour literal outside lib/theme.dart, and widgets read Theme.of(context).colorScheme and context.pillars.of(pillar), so no widget knows which mode it is in.

DARK COLORSCHEME ROLE TABLE

Role	Hex	Name	Used for
primary	#F5F3EE	Bone	Save button, active nav icon, chart outline
onPrimary	#1C1E1F	Night	Text and icons on primary
secondary / outline	#A6AAAC	Grey	Captions, hints, input borders, Cancel
surface	#1C1E1F	Night	Scaffold, cards, sheets, dialogs
onSurface	#F5F3EE	Bone	Body text
error	#F0847C	Error	Validation and destructive actions
outlineVariant	#3F4345	Line	Dividers, card borders
PillarColors (extension)	#7FA3C4 / #7FB36F / #E58A5A	Slate / Moss / Ember	Same roles as light, lighter so they read on Night. Text on a pillar fill is Ink, not white.

WHY THE PILLAR COLOURS CHANGE IN DARK

The light-mode pillar colours measure only 2.3:1 (Slate), 3.3:1 (Moss) and 3.3:1 (Ember) on Night, below the 4.5:1 target for small text. Dark uses lighter versions of the same three hues, so a pillar label still reads as its pillar. Because the fills are now light, text on a pillar fill flips from white to Ink.

TEXTTHEME SLOT TABLE

Style	Flutter slot	Family	Size	Wt.	Used for
Heading	`headlineLarge`	Space Grotesk	32	700	Screen titles: This week, Projects, Workouts
Section	`headlineSmall`	Space Grotesk	24	700	Sheet titles in Add entry
Body	`bodyMedium`	IBM Plex Sans	16	400	Card titles, field text, nudge text
Data	`labelLarge`	IBM Plex Sans	14	500	Hours, minutes, streaks; button labels
Caption	`labelSmall`	IBM Plex Sans	12	400	Section headers, subtitles, hints

USE BY NAME, NEVER BY LITERAL SIZE

```
Text('This week',
  style: Theme.of(context).textTheme.headlineLarge)

Text('LAST UPDATED'.toUpperCase(),   // no text-transform
  style: Theme.of(context).textTheme.labelSmall)
```

Spacing, as constants

THE LADDER (DRAWN 2×)

xs = 4

sm = 8

md = 16

lg = 24

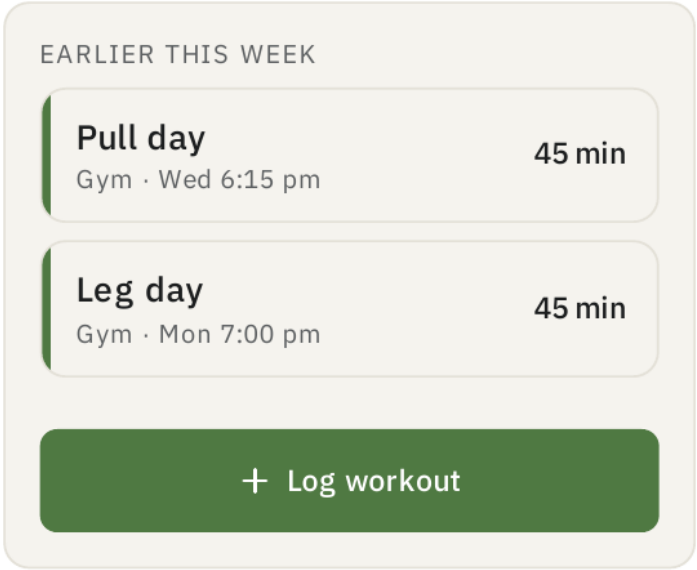

THE FOUR DECISIONS

Decision	Value	Constant	Where
Base unit	8	`AppSpacing.sm`	Everything is a multiple or the half-step of this
Screen edge padding	16	`AppSpacing.md`	Left and right of every screen
Gap between list items	8	`AppSpacing.sm`	Between cards in any list
Gap between sections	24	`AppSpacing.lg`	Between a section header and what is above

```
class AppSpacing {
  static const double xs = 4;    // inside components only
  static const double sm = 8;    // base unit, list gaps
  static const double md = 16;   // screen edge padding
  static const double lg = 24;   // between sections
}

// padding: const EdgeInsets.all(AppSpacing.md)
```

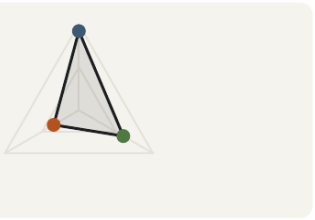

DRAWN AT TRUE SIZE (1 PT = 1 DP)

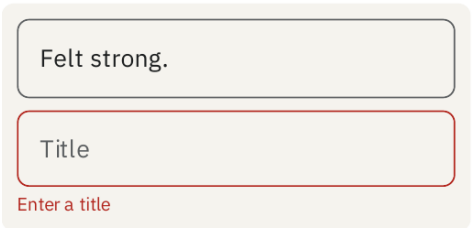

16 dp inside the screen edge · 8 dp between the two cards · 24 dp before the next section. Nothing here is a loose number; each one is `AppSpacing.md, .sm, .lg`.

Components, as files

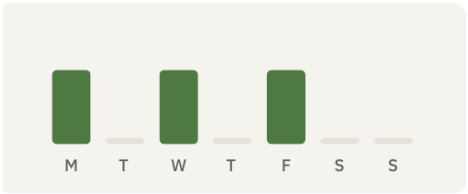

TrivetMark

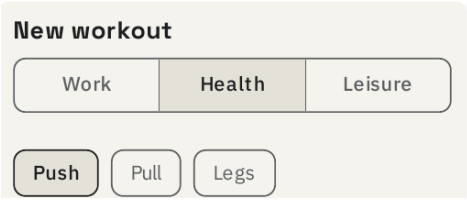

AppTextField

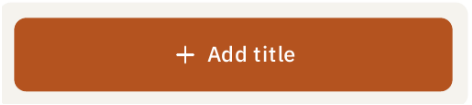

WeeklyBarChart

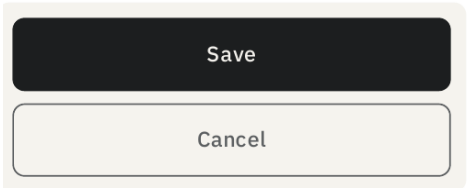

EntryModal

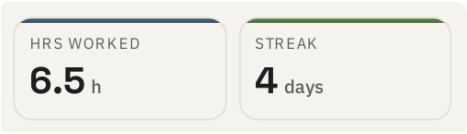

PillarButton

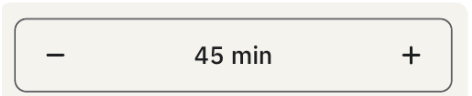

PrimaryButton

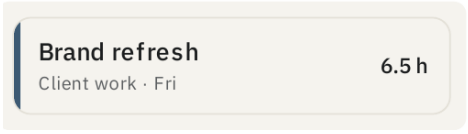

StatCard

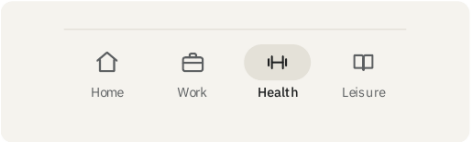

DurationStepper

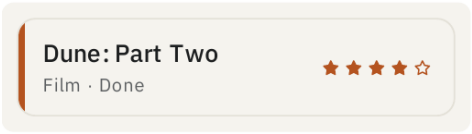

PillarCard

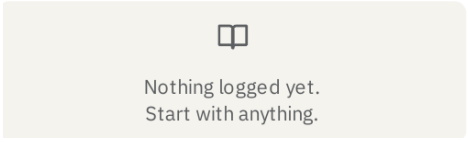

AppNav

MediaCard

EmptyState

Widget	Theme hook	Used for
OutlinedButton	`outlinedButtonTheme`	Cancel in Add entry (05)
ChoiceChip	`chipTheme`	Workout type, project, media status in Add entry (05)
SegmentedButton	`segmentedButtonTheme`	Status filter (02, 04), pillar picker (05)

Widget	Theme hook	Used for
Card	`cardTheme`	Nudge text on the Dashboard (01), chart container (03)
NavigationBar / NavigationRail	`navigationBarTheme` / `navigationRailTheme`	Inside AppNav, swapped at 900 dp

Components table

Component	File	Constructor parameters
TrivetMark	lib/widgets/trivet_mark.dart	double work, double health, double leisure, double size
StatCard	lib/widgets/stat_card.dart	Pillar pillar, String label, String value, List<double>? trend
PillarCard	lib/widgets/pillar_card.dart	Pillar pillar, String title, String subtitle, String meta, VoidCallback onTap
MediaCard	lib/widgets/media_card.dart	MediaEntry entry, String? progress, int? rating, VoidCallback onTap
PillarButton	lib/widgets/pillar_button.dart	Pillar pillar, String label, VoidCallback? onPressed
PrimaryButton	lib/widgets/primary_button.dart	String label, VoidCallback? onPressed
AppTextField	lib/widgets/app_text_field.dart	String hint, TextEditingController controller, int maxLines, String? errorText, VoidCallback? onTap
DurationStepper	lib/widgets/duration_stepper.dart	num value, ValueChanged<num> onChanged, num step, String unit
WeeklyBarChart	lib/widgets/weekly_bar_chart.dart	List<double> values, Pillar pillar, double height
AppNav	lib/widgets/app_nav.dart	int selectedIndex, ValueChanged<int> onSelected
EntryModal	lib/widgets/entry_modal.dart	Pillar pillar, String title, List<Widget> fields, VoidCallback onSave, VoidCallback onCancel
EmptyState	lib/widgets/empty_state.dart	String message, IconData icon, String? actionLabel, VoidCallback? onAction

THREE RULES THAT MAKE THESE BUILDABLE

1. A component takes data and callbacks, never setState. PillarCard gets onTap; the list that owns the data owns the state.

2. Phone-versus-desktop layout lives in the screen, not the component. The same PillarCard is a list row on phone and a grid cell on desktop. AppNav is the one exception, because it has to swap its own widget at 900 dp.

3. Pillar is an enum in theme.dart; components look its colour up with context.pillars.of(pillar) and never receive a hex value.

4. const wherever the constructor allows it. Free performance, and the linter will keep asking until you do.

```
class PillarCard extends StatelessWidget {
  const PillarCard({
    super.key,
    required this.pillar,
    required this.title,
    required this.subtitle,
    required this.meta,
    required this.onTap,
  });
  // ... build() reads context.pillars.of(pillar)
}
```

What changed, and why

Element	Prelim said	Now says	Why it changed
Leisure · Ember	#C4622D, 4.1:1 with white text	#B4531F, 5.0:1 with white text	White on the old Ember failed the 4.5:1 target on the + Add title button
Palette format	six swatches with hex values	full ColorScheme plus a PillarColors ThemeExtension	colorForType (m4a3) got copy-pasted into dex_list.dart and dex_home.dart with different shades each time. Swatches with no roles cannot become a scheme.
Error colour	none	#B3261E as error	Add entry has fields that can be invalid, so it needs a validation colour
Dark mode	not decided	light and dark, decided	Both follow the phone setting. It stays one extra ColorScheme because no colour literal lives outside theme.dart. The pillar colours are lighter in dark, since the light ones measure 2.3 to 3.3:1 on Night.
Type families	Space Grotesk, Plex Sans, Plex Mono	Space Grotesk + Plex Sans	Mono existed only for numbers; tabular figures do that job inside Plex Sans
Spacing	missing	base 8, constants 4 / 8 / 16 / 24	SizedBox gaps were random (4, 6, 12, 20) until dex_app.dart (m5a5) settled on multiples of 4. The mockup is drawn to them: 16 edge, 8 between cards, 24 between sections.
Components	drawings, no files	twelve files with parameters, five styled built-ins	_MonsterCard and _MonsterDetailScreen (m5a5) duplicated the same avatar/badge markup. I pulled them into _Avatar and _TypeBadge so each one appears on a screen.
MediaCard	not present, PillarCard was to carry media	its own file and parameters	Painting screen 04 showed a media row needs kind, status, hours and a rating — two more slots than PillarCard has
EmptyState	not present	its own file	Leisure is the pillar most likely to be empty, and all three list screens need the same empty shape

ADD YOUR OWN EVIDENCE BEFORE SUBMITTING

The rows on the left are justified by the contrast measurements and by the mockup. The change log is worth more with your own build history in it: name the m4 or m5 activity where you saw each problem — which screen had the hardcoded colour, which text was hard to read on your phone outdoors, which widget you copy-pasted twice before it became a component. “I kept it” is a valid row if you say what confirmed it.

THE FILE THIS BECOMES

`lib/theme.dart` is written and ready to paste: the ColorScheme pair (light and dark), the PillarColors extension, the five text styles, AppSpacing, and themed Card, FilledButton, OutlinedButton, InputDecoration, NavigationBar, NavigationRail, Chip and SegmentedButton. It is the only file in the app allowed to contain a colour literal or a font size. Wire it with theme: appTheme, darkTheme: appDarkTheme, themeMode: ThemeMode.system.

Needs one dependency: `flutter pub add google_fonts`.

CHECK BEFORE YOU HAND IN

Run the app once on a phone, in daylight, and look at the caption grey on Paper. Then grep the project for `Color(0x` and `fontSize:` outside theme.dart. Both should come back empty.
