Dashboard (home)

What the user does here

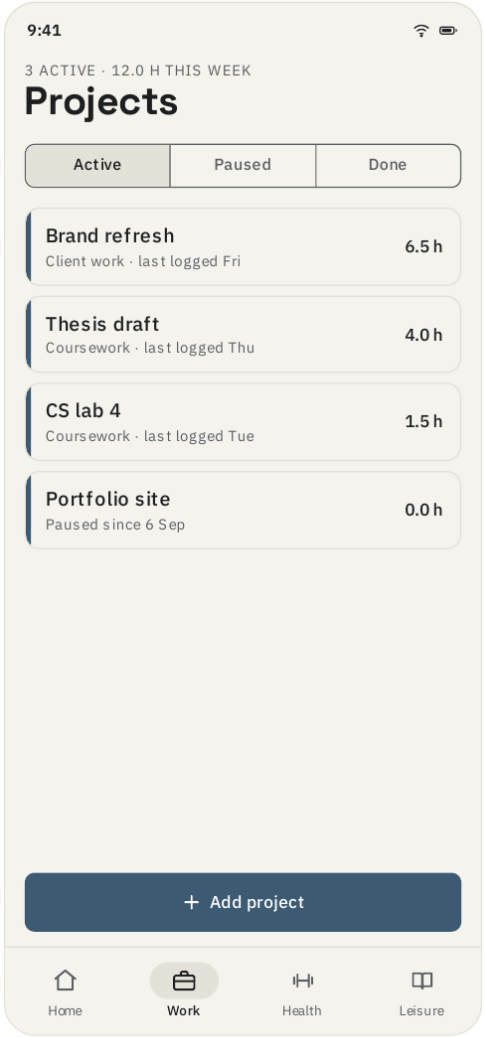

Opens the app and reads the week in one look: the triad chart shows whether the three pillars are level, the three stat cards give the raw totals, and the nudge names the thinnest pillar. From here the user either logs something or moves into a pillar tab.

WHERE EACH TAPPABLE THING GOES

1. **Triad chart leg** — tapping a leg opens that pillar's tab (Work, Health or Leisure)
2. **Stat card** — same target as the leg above it; opens the pillar tab
3. **SEE ALL** — opens 04 Leisure filtered to In progress
4. **Media card** — opens the Leisure detail for that title
5. **+ Log entry (PrimaryButton)** — opens 05 Add entry with the pillar picker unset
6. **AppNav** — Home, Work, Health, Leisure; persistent on all four screens

SCREEN 02

Work

What the user does here

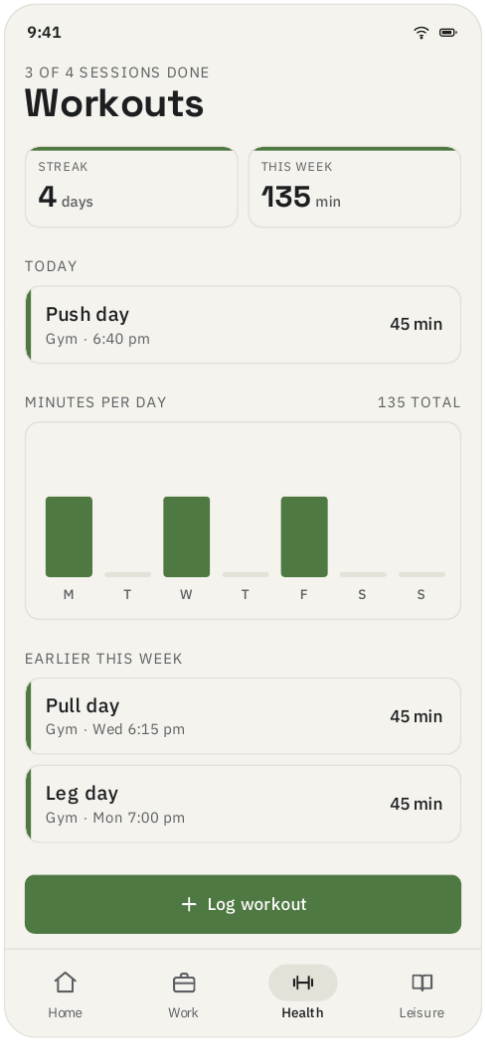

Sees every project, its status and the hours logged against it this week, then logs hours to one of them. The segmented filter is the only sort: Active first, because a paused project is not what the user came here for.

WHERE EACH TAPPABLE THING GOES

1. **Status filter (SegmentedButton)** — filters the list in place; no navigation
2. **Project row (PillarCard)** — opens that project's log; the whole row is the target, not just the title
3. **+ Add project (PillarButton)** — opens 05 Add entry with Work pre-selected
4. **AppNav** — Work tab is the active one

SCREEN 03

Health

What the user does here

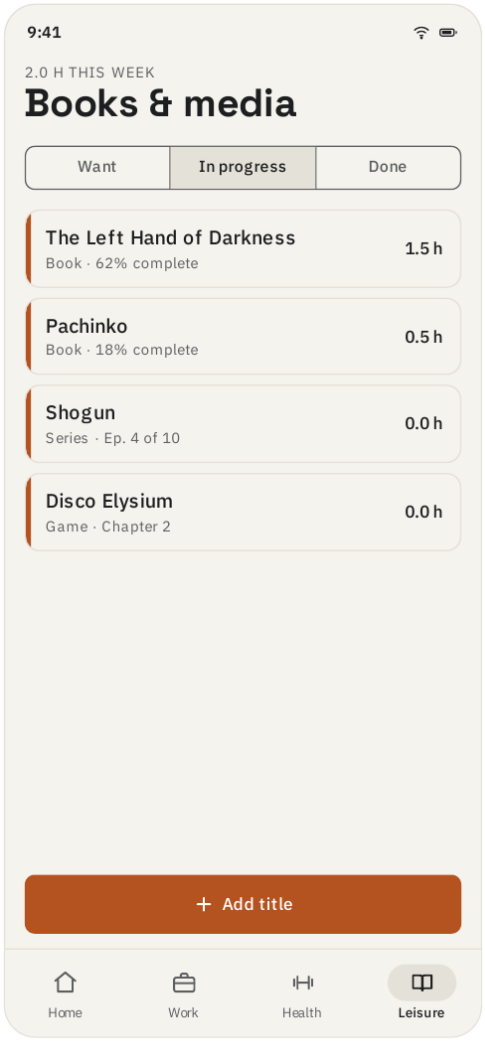

Checks whether the streak survives today, logs the session that keeps it alive, and reads the week as bars rather than as a number. Minutes, not sessions, because a 10-minute walk and a 90-minute gym session are not the same entry.

WHERE EACH TAPPABLE THING GOES

1. **Stat card** — streak and weekly minutes; not tappable, they are read-only summaries
2. **Today's log (PillarCard)** — opens 05 Add entry pre-filled with that workout, for editing
3. **+ Log workout (PillarButton)** — opens 05 Add entry with Health pre-selected

SCREEN 04

Leisure

What the user does here

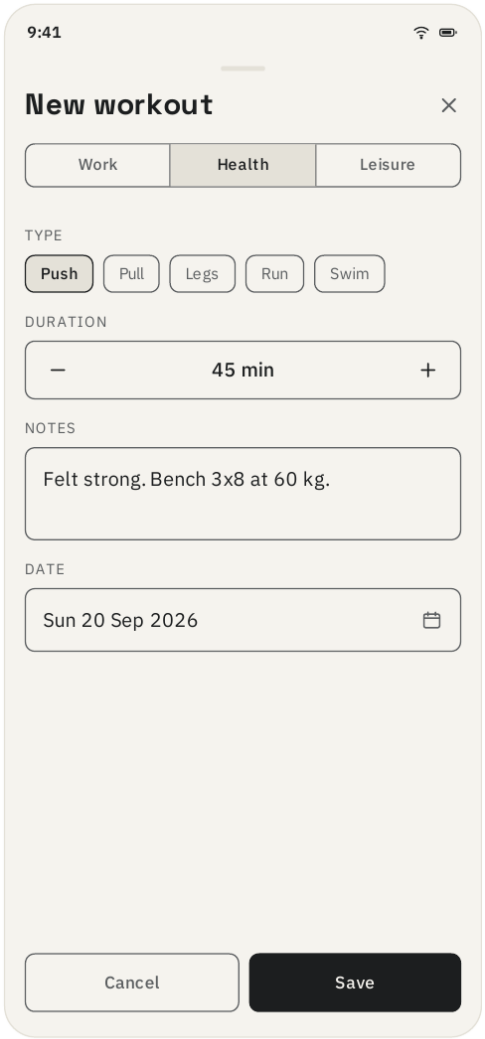

Keeps a shelf of what is being read, watched or played, moves a title between Want, In progress and Done, and logs the time spent on it. This is the pillar most likely to be empty, so the filter defaults to In progress.

WHERE EACH TAPPABLE THING GOES

1. **Status filter (SegmentedButton)** — want / in progress / done; filters in place
2. **Media card (MediaCard)** — opens the title's detail, where rating and progress are set
3. **+ Add title (PillarButton)** — opens 05 Add entry with Leisure pre-selected

SCREEN 05

Add entry (shared modal)

What the user does here

Logs one entry into any pillar without leaving the tab they were on. One sheet, one shape: the pillar picker at the top swaps the field set below it, and Save returns to the tab the sheet was opened from.

WHERE EACH TAPPABLE THING GOES

1. **Pillar picker (SegmentedButton)** — swaps the fields below; pre-selected when opened from a pillar tab
2. **Type chips (ChoiceChip)** — single choice; the set changes per pillar
3. **DurationStepper** — 45 min in steps of 5; steps of 0.5 for Work hours
4. **Date field (AppTextField)** — read-only, onTap opens showDatePicker
5. **Cancel (OutlinedButton)** — discards and returns to the calling tab
6. **Save (PrimaryButton)** — validates, writes to shared_preferences, returns to the calling tab

What changed, and why

Screen or element	The wireframe assumed	The mockup shows	What I will change
Dashboard	chart, three stat cards, a nudge and a “currently enjoying” shelf all sit above the nav	with 16 dp edges and 24 dp between sections, only two shelf rows fit under the chart before the + Log entry button is pushed off-screen	the shelf is capped at two rows with a SEE ALL that opens Leisure; the rest of the shelf lives on 04
Leisure rows	the same PillarCard as Work and Health carries a media title	a media row needs kind, status, hours and a star rating — two more slots than PillarCard has	add MediaCard (lib/widgets/media_card.dart) to the design system; PillarCard stays as it is for Work and Health
Health chart	“weekly bar chart”, size unstated	at 132 dp the bars read clearly and the streak cards still fit; below about 110 dp the day labels crowd the bars	fix WeeklyBarChart at 132 dp on phone and pass the height rather than hardcoding it
Add entry	fields stacked with no labels drawn	unlabelled fields are ambiguous once real content is in them — a date and a note look alike	each field gets a 12 dp caption label above it; labels are part of EntryModal, not of AppTextField
Pillar colour	pillar colour used on accents only	the pillar buttons carry white text on the pillar fill, which is where the 4.5:1 check actually matters; Ember at #B4531F passes at 5.0:1	keep v2 Ember; no colour was invented for the mockup and nothing on these five screens sits outside the palette

WHAT DID NOT CHANGE, AND WHY I AM CONFIDENT

The navigation, the five screens and the one-sheet Add entry survived painting them in unchanged. The type scale needed no new size: every string on these screens is one of the five named slots, and the only sizes that appear are 32, 24, 16, 14 and 12. The spacing ladder held too — 16 dp screen edges, 8 dp between list items, 24 dp between sections — which is the check this exercise exists to make.
